North Carolina Experience with Embedded Data Collectors

Mohammed A. Mulla, P.E., CPM, MCE.
Assistant State Geotechnical Engineer / Contract and State wide Manager
North Carolina Department of Transportation
Geotechnical Engineering Unit

August 13, 2014
Presentation Outline

• NCDOT History with Dynamic Testing
• NCDOT Familiarity with EDC
• Experience with EDC
• Current and Future Plans for EDC
• Benefits of Using EDC
NCDOT History with Dynamic Testing

Pile Dynamic Testing

- 1987 GC back PDA – Pile Driving
- 1997 PDA with DOS PAK version
- 2001 PDA with Window version

**GC – Blue Box**

**PAK-DOS**

**PAK-Window**
NCDOT History with Dynamic Testing

Pile Integrity Testing

- 1992 PDI (Pile Integrity Testing)
- 1993 TNO (Sonic Integrity Testing)
- 2007 PIT-W (Unknown Foundation)
Pile Dynamic Testing Process

During Design Process – GRLWEAP (WEAP)
- Driveability analysis
- Select hammer size (assume hammer)
- Recommend specific range of hammer energy

During Construction
- Evaluate the specific hammer submitted by contractor
- Provide driving criteria
- If PDA is recommended, then CAPWAP will be used to refine WEAP analysis to generate driving criteria

Embedded Data Collectors

Our familiarity with Embedded Data Collectors (EDC)

• 2002 - FDOT and University of Florida research – Estimating pile capacity during construction was completed

• 2003 - Smart Structures got license agreement from University of Florida

• 2007 - FDOT mandated that all of their test piles must have EDC to collect enough data to conduct their own comparison with PDA and static load tests

• 2010 - FDOT adapted the use of EDC in their special provision

• AFT and Smart Structures communication with us
NCDOT Experience with EDC

- 2007- NCDOT agreed with AFT to try the EDC in 2 piles
- B-1381 Sampson County 12” (305mm) Prestressed Concrete Pile –See Table 1

The pile driving template was used for determining the pile tip penetration and counting blows during pile driving. Pile size, length, gauge locations, and radio identification numbers are summarized in Table 1.

<table>
<thead>
<tr>
<th>Pile Designation</th>
<th>Pile Size (inch)</th>
<th>Pile Length (feet)</th>
<th>Top Sensor Location Below Pile Top (inches)</th>
<th>Bottom Sensor Location Above Pile Toe (inches)</th>
<th>Radio Identification Number</th>
</tr>
</thead>

Do not use the EDC Consultant shown above for the PDA consultant on the prestressed concrete piles

The EDC Consultant will provide and install the EDC during pile fabrication. Notify the Engineer of the pile fabrication schedule a minimum of 14 calendar days in advance. The EDC Consultant will record dynamic measurements during initial drive, restrikes and redrives. Notify the Engineer of the pile driving schedule in accordance with the File Driving Analyzer Special Provision.

3.0 Measurement and Payment

There will be no payment for the EDC. The Department will contract with the EDC Consultant directly to provide the EDC and associated installation, recording, analysis and reporting.

The cost of the PDA will be paid for separately in accordance with the Pile Driving Analyzer Special Provision (November 20, 2006). The cost of the pile and the installation including driving, restriking and redriving will be paid for separately in accordance with the Standard Specifications.

EDC Force Comparison to PDA

This is a sample image. Similar documentation will be posted to the All EMBEDDED DATA COLLECTORS website in the near future.
The EDC was more expensive than the PDA (probably twice the cost) and for that reason we did not pursue the EDC as another dynamic test method at that time.

It was an issue to use and recommend a technology with sole source without proper justification.

Without trying and confirming the results of the EDC with static load tests and PDA, it would be very hard for us to accept and implement such technology.

Smart Structures mentioned a few future changes that will enhance the results of the analysis.
EDC

Current and Future Plans for EDC

2011

NCDOT designated a couple of projects to use EDC, PDA, and Static Load tests.

2013

1. R-3307 New Bridge over Gallants Channel in Carteret County: Unfortunately, this project was delayed letting multiple times. Current letting date is January 2014

2. R-2633BB Dual Bridges on –L- (US17) over Cape Fear River in Brunswick and New Hanover Counties. Current letting date is September 2013

- A total of four (4) EDC are required for the same prestressed concrete piles tested with the Pile Driving Analyzer (PDA)
- One (1) EDC on the Static Axial Compressive Load Test pile

Bridge Length = 3,395’

NCDOT Current and Future Plans for EDC

- EDC is ready to use technology (FDOT success)
- NCDOT is pursuing this technology by taking the first step (two pilot projects)
- The outcome from the two proposed pilot projects will determine the implementation program
- The AASHTO All (TIG) program
Benefits

- Cost
- Eliminating over driving piles
- Detect pile tip damage
- Efficient (time)
- Improving safety
- Reuse existing foundation (future testing)
Thank You Very Much
